Chapter 1

PROJECT AND ITS BACKGROUND

Project Context

Provide an overview of your project. Explain what your study is about, its background, and why it is important. Discuss the problem or need that your project will address, the purpose of the study, and the expected outcome.

Example: Describe how your project idea started, what issue it solves, and how it can benefit users or organizations.

Problem Statment

State clearly the main problem your project seeks to solve. Explain what issues exist and how your proposed system or study will address them.

Example: The purpose of this capstone project is to develop a system that will...

Objectives of the Study

List the specific goals you want to achieve through this project. Start each objective with “To…” and make sure each is measurable and realistic.

Example:

1. *To design and develop a web-based attendance system.*
2. *To provide a user-friendly interface for both students and instructors.*
3. *To generate accurate and automated attendance reports.*

Significance of the Study

Explain why your study is important and who will benefit from it. Identify the stakeholders such as students, teachers, administrators, or organizations that will gain advantages from your project.

Example: This study is significant because it provides a faster and more reliable way to record attendance, which benefits both students and faculty members.

Scope and limitations

Describe what your project will cover (scope) and what it will not include (limitations). This helps define the boundaries of your study.

Example: The system will focus only on student attendance monitoring within ACLC College of Bukidnon and will not include integration with other campuses.

Definition of Terms

List and define key technical terms, acronyms, or concepts used in your study. Provide definitions that are clear and relevant to your project.

Example:

Database: *A structured collection of data that can be accessed and managed electronically.*

User Interface (UI): *The visual part of the system through which users interact.*

Algorithm: *A set of instructions used to perform a specific task or solve a problem.*

Chapter 2

REVIEW OF RELATED LITERATURE AND STUDIES

This chapter presents the review of related literature and systems relevant to the proposed study. It discusses previous research, existing systems, and various concepts that support the development of the web-based attendance system. The purpose of this review is to identify gaps, gather insights, and strengthen the foundation of the proposed project.

Related Literature

The review of related literature focuses on studies, theories, and concepts that are relevant to attendance monitoring, automation, and information systems.

According to [Author, Year], automated systems help improve accuracy and reduce human errors compared to manual methods. Another study by [Author, Year] emphasizes that web-based applications provide flexibility and accessibility, allowing users to manage data anytime and anywhere.

Various studies have also shown that implementing digital attendance systems enhances efficiency in record management and minimizes the workload of instructors. These findings serve as the basis for developing a system that can monitor attendance accurately and efficiently.

Related Systems

Several attendance systems have been developed to automate the process of monitoring student presence.

RFID-Based Attendance System

This system uses Radio Frequency Identification (RFID) cards to record attendance automatically. It provides fast scanning and secure identification but requires specific hardware, which can be costly to implement.

Biometric Attendance System

This system uses fingerprints or facial recognition to mark attendance. It ensures accuracy and prevents proxy attendance but requires additional setup and maintenance.

Web-Based Attendance System

This system allows instructors and students to record and access attendance through an online platform. It is cost-effective, easy to access, and ideal for institutions with existing internet infrastructure.

The proposed system adopts features of the web-based approach while integrating automation, data accuracy, and ease of use for both students and instructors.

Chapter 3

RESEARCH METHODOLOGY

This chapter presents the methodology that will be used in the development of the proposed Web-Based Attendance System. It discusses the research design, system development methodology, data collection methods, target respondents, and the tools and technologies to be used. The purpose of this chapter is to provide a detailed plan on how the project will be implemented and evaluated.

Research Setting

The study will be conducted at [Insert Location], specifically in [mention specific area, e.g., classrooms, offices, or online platform]. This location was chosen because it is directly relevant to the participants and the context of the study.

The primary beneficiaries of this research include:

***Students** – They will benefit from improved access to tools and resources, or insights that may enhance their learning experience.*

***Instructors/Teachers** – The findings can help them implement more efficient strategies or systems, such as the proposed web-based attendance system.*

***The Institution** – The research outcomes may assist in streamlining administrative processes, improving record management, and enhancing overall operational efficiency.*

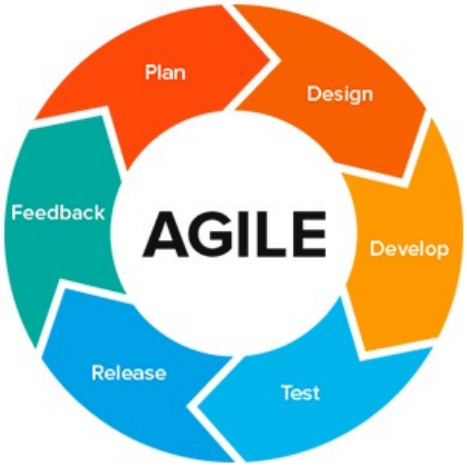

By conducting the study in this setting, the research aims to provide practical solutions that directly address the needs and challenges experienced in the educational environment.

Research Design

The study will utilize a developmental research design, focusing on designing, developing, and testing a web-based attendance system. This approach allows the researchers to create a system that addresses the problems identified in Chapter 1 while evaluating its effectiveness and usability.

System Development Methodology

*The **Agile/Waterfall (choose one)** methodology will be used to guide the system development process. This includes the following phases:*

***Planning** – Define project objectives, identify system requirements, and set timelines.*

Analysis *– Gather requirements from target users (students and instructors) and study existing attendance practices.*

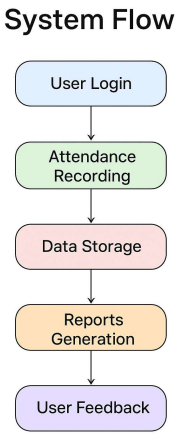

Design *– Create system architecture, database design, and user interface prototypes.*

Implementation/Coding *– Develop the web-based attendance system using appropriate programming languages and frameworks.*

Testing *– Conduct system testing to check for errors, bugs, and usability issues.*

Deployment and Evaluation *– Deploy the system and gather feedback from users for further improvements.*

System Flow

The system will follow these main processes:

User Login *– Students and instructors log in using secure credentials.*

Attendance Recording *– Instructors mark attendance, or students log their presence depending on system settings.*

Data Storage *– Attendance records are saved in the database.*

Reports Generation *– The system generates automated attendance reports for students and instructors.*

User Feedback *– Users can view and verify their attendance records.*

System Architecture

ADD SCREENSHOT OF YOUR SYSTEM ARCHITECTURE

The system architecture shows the interaction between users, the interface, the processing logic, and the database. For your system, the flow can be described as follows:
